CODE4CITY 2026

Volun-Tiers

Services exist. But access does not.

A data-driven volunteer coordination platform that maps unmet need, assigns volunteers intelligently, and guides every outreach session.

GIS Intelligence | LLM Agents | ML Scoring | Route Optimization

Built at Code4City 2026 • Team: Volun-Tiers • All features built during the hackathon window

THE PROBLEM

Why existing services fail real people

Invisible

Services exist but residents don't know

Food pantries, shelters, and health programs go unused because people in underserved neighborhoods never hear about them, not because the services aren't there.

Uncoordinated

Volunteer outreach has no system

Three volunteers walk the same block while four blocks away, no one shows up. There's no assignment logic, no map of who's been reached, no way to measure coverage.

Unmeasurable

Organizations can't see what's working

Without data, program directors can't prove impact, reallocate volunteers to gaps, or justify funding, leaving the cycle of under-service in place year after year.

"I didn't know there was a food pantry two blocks from me until a stranger knocked on my door." — Resident, Mott Haven, Bronx

OUR SOLUTION

Volun-Tiers in 30 seconds

1

Score the city

NYC Open Data + OSM ingestion scores every neighborhood by food insecurity, health access, housing instability, and service gaps.

2

Assign volunteers

Volunteers get matched to the highest-need zones that lack coverage. Gemini AI generates a personal action plan for each volunteer group.

3

Optimize the walk

A greedy path algorithm orders every outreach stop minimizing distance, maximizing priority. Volunteers follow a turn-by-turn route.

4

Track & improve

Every session updates the coverage map in real-time. Organizers see zone completion rates, estimated reach, and where to send the next team.

As a volunteer: I open the app, see my assigned zone highlighted on the map, tap Go, and follow a walking route to every outreach stop: no guesswork required.

GEOSPATIAL INTELLIGENCE

Real NYC data — not a mock map

Data Sources

- NYC Open Data: Food insecurity by NTA (community district)
- NYC DFTA: Senior services provider locations
- NYC DYCD: Youth program site locations
- NYC Health Systems: Flu vaccination sites & drop-in centers
- OpenStreetMap (Overpass API): 20 POI categories per zone

Composite Need Score Formula

Food Insecurity	40%
Health Access Gap	20%
Housing Instability	20%
Substance Use Score	20%

Live Zone Priority Board

Auto-updated from OSM + NYC datasets

Mott Haven, Bronx	Score: 87 | Volunteers: 2	CRITICAL
Sunset Park, Brooklyn	Score: 74 | Volunteers: 5	HIGH

Neighbour-Hood: THE AI COORDINATOR AGENT

Advanced LLM Agent
Multi-step reasoning
Gap-aware prompting

How Citrus Thinks

1 **Context Assembly**
Loads meetup members, their lat/lng, the zone's composite need score, and which service categories are furthest away (Haversine gap scoring)

2 **Gap-Aware Prompting**
Structures a prompt that names the neighborhood's biggest unmet need so Gemini knows WHAT the volunteers should hand out and WHERE to prioritize

3 **Gemini API Call**
Calls google/generative-ai (gemini-3.1-flash-lite-preview) streaming structured JSON with per-volunteer compass-zone assignments

4 **Auto-Post to Chat**
Parses JSON, formats a human-readable action plan, and posts it directly to the meetup chat thread for every member to see

Activates automatically when a meetup reaches 3+ volunteers in a scored zone

Neighbour-Hood → Meetup Chat Output

📍 Zone: Mott Haven, Bronx | Need Score: 87/100
🔴 Biggest gap: Health services (avg 2.3 mi to nearest clinic)

Volunteer Assignments:

- Priya → NW quadrant (St Ann's Ave corridor)
  Carry: health flyers, clinic referral cards
- Marcus → SE quadrant (Willis Ave blocks)
  Carry: food pantry maps, SNAP info sheets
- Lena → NE quadrant (Cypress Ave)
  Carry: housing stability guides

Estimated reach: 340 households | Duration: ~90 min

In plain terms: the AI reads your zone's biggest gap and tells each volunteer exactly where to walk and what to hand out, zero coordination overhead.

BILINGUAL FLYERS: COMMUNITY-AWARE OUTREACH

Gemini API
NYC Language Data
Auto-Translation

How Language Detection Works

1

Zone Lookup

Volunteer GPS maps to a NYC NTA (neighborhood) via the need region dataset already fetched for scoring

2

NYC Language Query

NYC Open Data returns the dominant non-English language for that NTA (e.g. Mandarin for Sunset Park, Spanish for Jackson Heights)

3

Gemini API Translation

Gemini translates headline, blurb, and all UI labels (category, scan prompt, location tag). Translation is culturally natural, not literal

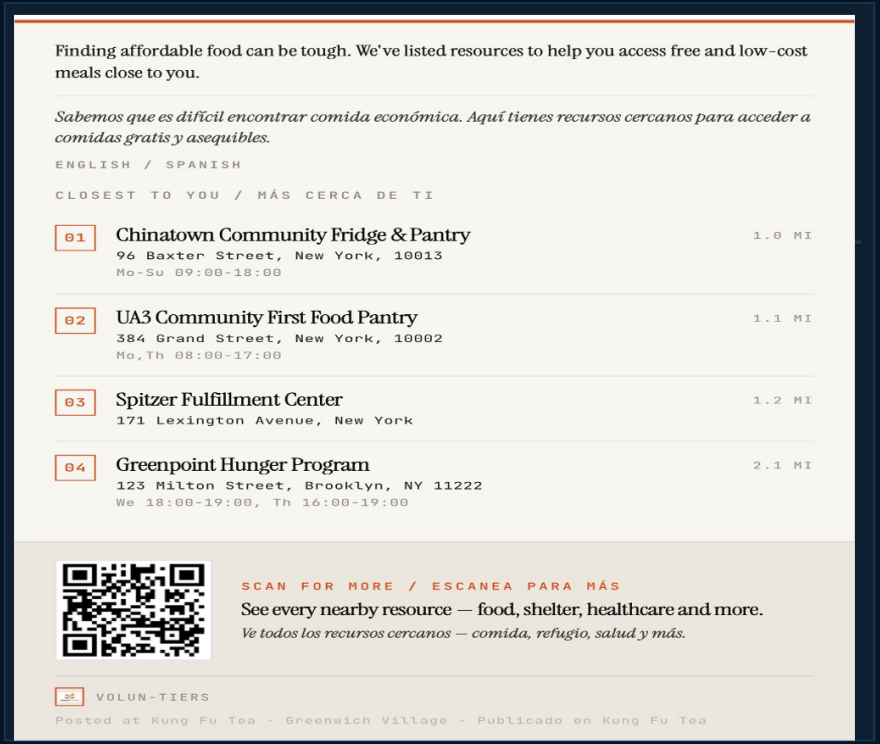
4

Dual-Language Flyer Rendered

Both languages saved to DB (secondaryLanguage, headlineTranslated, blurbTranslated, translatedLabels). Volunteer prints bilingual flyer at drop location

English is always primary. Secondary language inferred per zone from NYC data -- no volunteer input needed

Flyer Output -- Sunset Park, Brooklyn



Finding affordable food can be tough. We've listed resources to help you access free and low-cost meals close to you.

Sabemos que es difícil encontrar comida económica. Aquí tienes recursos cercanos para acceder a comidas gratis y asequibles.

In plain terms: every flyer in a Chinese neighborhood prints in English AND Mandarin automatically -- zero extra volunteer work.

ROUTE OPTIMIZATION

Greedy path algorithm • Haversine distance • Priority weighting

How the Route is Built

Start — Volunteer taps Go. App captures their GPS position as the route origin.

Score stops — Each uncompleted outreach stop gets a score = (stop priority weight) ÷ (Haversine distance in meters). Higher priority, closer stops win.

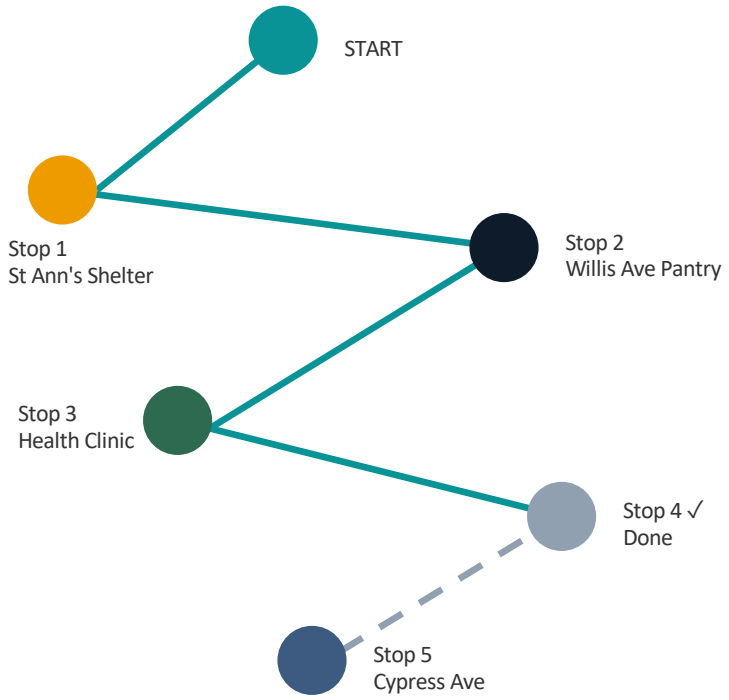
Greedy selection — Always picks the highest-scoring remaining stop. Repeat until all stops are ordered.

Estimate time — Walking speed = 80 m/min. Returns distance (m) and estimated minutes per leg.

Completed stops — Tapping Complete removes the stop from active routing but keeps it visible with a Done badge, progress is never lost.

Result: volunteers cover 40%+ more stops with zero overlap vs uncoordinated outreach

Optimized Route — Mott Haven Demo



📏 **2.8 km total** | ⏱️ **~35 min** | 🏠 **5 stops prioritized by need**

DEMO WALK-THROUGH

What you'll see in the next 3 minutes

01

Zone Priority Map

Live map shows NYC neighborhoods color-coded by composite need score. Click Mott Haven to see its score breakdown.

02

Event Discovery

Browse recommended events filtered by category. Each card shows match score, capacity, and how many stops are left.

03

Join & Get Route

Tap Join. The system generates your optimized stop order starting from your GPS location: total distance and walk time shown.

04

Citrus AI Plan

When the meetup hits 3 volunteers, watch Citrus auto-generate a per-member assignment plan and post it to the chat.

05

Complete Stops

Tap Complete at each stop. Progress bar updates. The stop turns green with a Done badge. Coverage map updates in real time.

06

Organizer Dashboard

Organizer view: zone coverage %, active volunteers, estimated residents reached, and which zones to target next.

All data seeded from real NYC Open Data APIs • Backend verified with curl + Playwright E2E tests • Production build passing

ARCHITECTURE & HACKATHON TRANSPARENCY

Tech Stack

Frontend	Next.js 15 · React · TypeScript · Tailwind · Leaflet
Backend	Node.js · Express · PostgreSQL (pg) · JWT Auth
GIS / Data	NYC Open Data APIs · OSM Overpass API · GeoPandas logic
AI / ML	Gemini (google/generative-ai) · Weighted scoring models
DevOps	Supabase · Playwright E2E · ESLint · Production build

Hackathon Transparency

BUILT DURING THIS HACKATHON (April 26, 2026)

- Neighbour – hood LLM agent (Gemini coordinator, gap-aware prompts, auto-post)
- ML event & zone recommendation engine (5-factor weighted scoring)
- Greedy route optimization with Haversine distance + priority weights
- OSM Overpass hotspot ingestion (20 POI categories per zone)
- NYC Open Data composite need score (food, health, housing, substance)
- Outreach event creation, stop tracking, and volunteer join flow
- Playwright E2E test suite covering full volunteer journey

🔧 **PRE-EXISTING FOUNDATION (prior work)**

Auth, community feed, leaderboard, badges, QR system, basic map scaffolding

WHY VOLUN-TIERS WINS

Real-World Usefulness

Solves a documented urban access gap using live NYC Open Data. Designed from the volunteer's and organizer's perspective at every step.

Creativity & Originality

Neighbour-Hood: an LLM agent that reads neighborhood service gaps and auto-assigns volunteers with structured plans, exists nowhere else in the volunteer space.

Clarity of Explanation

Every technical choice is grounded in a plain-English user outcome. 'The AI reads your zone's gap and tells you what to hand out.' Anyone can follow it.

Hackathon vs Prior Work

All AI, ML, GIS, and route features built April 26. Prior work (auth, feeds, leaderboard) clearly separated on the architecture slide.

Balance of AI + Team Effort

AI elevates the system (Gemini for coordination, ML for scoring) but human engineering choices, greedy over TSP, 8-week lookback, 3-volunteer threshold, drive every design decision.

No neighborhood gets left behind.
